Sweden

Camurus AB is a biopharmaceutical company that creates long-acting treatments for serious and chronic diseases. This company originated in 1991. Camurus, based on scientific understanding, aims to enhance patient outcomes through innovative therapies. They specialise in pharmaceutical commercialization and have a portfolio that includes clinical trial products as well as two FDA-approved drugs.

Development state and regulatory approval

Active Pharmaceutical Ingredient (API)

Buprenorphine

Development Stage

Marketed

Regulatory Approval

Buprenorphine long acting is approved under the brand name - Brixadi by US FDA and as Buvidal by EMA for Opoid Dependence.

Description

FluidCrystal Technology is an advanced injectable formulation utilizing endogenous lipids, characterized by low viscosity and long-acting properties. This technology enables the administration of active pharmaceutical ingredients (APIs) with controlled release durations ranging from days to months. The mechanism underlying this system involves reversed non-lamellar liquid crystalline phases, which facilitate the efficient encapsulation of APIs. These phases ensure a sustained and steady-state release of the API into the bloodstream, thereby enhancing therapeutic efficacy.

Technology highlight

• Self assembling lipids forms a nanostructure reversed-phase nonlamellar liquid crystal around the API in an aqueous environment • Easy and convenient administration • High treatment adherence • Adapted to prefilled syringes and pen injection devices • Small injection volume with a thin needle.

Technology main components

The level of each component varies based on the physiological and chemical properties of the API a) One or more neutral diacyl lipids and / or at least one tocopherol b) One or more 5–90% phospholipids c) One or more biocompatible , oxygen-containing, or low-viscosity organic solvents d) At least one bioactive agent is dissolved or dispersed in the low-viscosity mixture e) One or more oxygen-containing solvent selected from alcohols , ketones , esters , ethers , amides and sulfoxide

Information on the raw materials sourcing, availability and anticipated price

The price of Brixadi (FDA approved FluidCrystal drug) is 459.13 USD. Camurus obtains commercially available, high-quality sources of key components for FluidCrystal formulation.

Delivery device(s)

No delivery device

APIs compatibility profile

API desired features

Water-soluble molecules

Water-insoluble molecules

Small molecules

Small molecules that are targeted for FluidCrystal Technology are Opioids, local analgesics, hormones, anti-emetics, local antibiotics, and prostacyclins

Proteins

Peptides & proteins that are targeted for FluidCrystal Technology are somatostatin & analogues, LHRH agonists, Glucagon & insulin, GLP-1 & analogues, MC4 agonists, and antibody fragments

Manufacturing

Manufacturing and distribution of Camurus’ products is based on a multi-stage supply chain with several participants involved. Braeburn Pharmaceuticals overlooks the manufacturing of the FDA approved drugs of FluidCrystal in liaison with a third party manufacturer. The manufacturing process includes: - Compounding - Filtration - Filing The aim of the manufacturing process setup is to reduce product manufacturing waste by 20% and to increase the use of packaging material originating from sustainable sources to at least 50%.

Specific analytical instrument required for characterization of formulation

The listed analytical instrument used was HPLC with UV detection

More details

This is a Phase III, placebo-controlled, multicenter study with an enriched-enrollment withdrawal (EEW) design to evaluate the efficacy and safety of CAM2038 in opioid-experienced subjects with moderate to severe CLBP that requires continuous, around-the-clock (ATC) opioid treatment ≥ 40 mg morphine equivalent dose (MED). The study includes 5 phases: A Screening Phase (up to 2 weeks), a Transition Phase (up to 2 weeks), an Open-Label Titration Phase (up to 10 weeks), a Double-Blind Treatment Phase including a Final Study Visit (12 weeks), and a Follow-up Phase (4 weeks). The overall duration of participation in the core phase of the study (randomized Double-Blind Phase) is up to 30 weeks, from the Screening Phase through the Follow-up Phase.

Inclusion Criteria: 1. Written informed consent provided prior to the conduct of any study-related procedures. 2. Male or non-pregnant, non-lactating female subject, greater than or equal to 18 years old. 3. Body mass index (BMI) between 18 and 38 kg/m2, inclusive. 4. Treated with daily opioids for moderate to severe CLBP for a minimum of 3 months prior to Screening. 5. On a stable dose of ≥40 mg/day of oral morphine or MED during the 14 days prior to Screening. 6. Systolic blood pressure ≥100 mmHg and diastolic blood pressure ≥60 mmHg. 7. Female subject of

childbearing potential who is willing to use a reliable method of contraception during the entire study (Screening Visit to final Follow-up). To be considered not of childbearing potential, female subjects must be surgically sterile.

More details

The purpose of the trial is to compare the effectiveness and safety of 2 treatment regimens of CAM2029 (given weekly or every 2 weeks) to placebo in participants with symptomatic PLD, either isolated as in autosomal dominant PLD (ADPLD) or associated with autosomal dominant polycystic kidney disease (ADPKD). In the Treatment Period of the trial, participants will be allocated at random to 1 of the 3 treatment arms in a 1:1:1 ratio. After completing the Treatment Period (53 weeks) participants may proceed to a 24-week open-label extension part of the trial and then only receive the same CAM2029 treatment. The active ingredient in CAM2029, octreotide, is administered as a subcutaneous depot using Camurus' FluidCrystal® technology.

- Monolithic

Release properties

Upon administration of the FluidCrystal SC injection, lamellar liquid crystal nanoparticles are formed by phospholipids in conjunction with the active pharmaceutical ingredient (API). This structural formation results in an initial burst release of the API into the fatty tissue environment. Subsequently, the plasma concentration of the API gradually decreases, yielding a near dose-proportional drug release over a target period of four weeks. Furthermore, repeated weekly administrations of the FluidCrystal product demonstrate smaller and less frequent fluctuations in the plasma concentration.

Injectability

Use a 23 to 25 gauge, 5/8-inch needle for the subcutaneous FluidCrystal injection. Clean the injection site and inject into the subcutaneous tissue of the abdomen, upper arm, or thigh, rotating sites each time.

Safety

A recent study aimed to evaluate the safety and efficacy of Buprenorphine administered via weekly or monthly subcutaneous (SC) injection using the FluidCrystal technology, compared to the traditional daily sublingual administration. Among the 215 patients assigned to receive SC Buprenorphine, 128 reported experiencing at least one adverse effect. The most frequently observed adverse events included injection-site pain, headache, constipation, nausea, as well as injection-site pruritus and erythema.

Stability

Not provided

Storage conditions and cold-chain related features

FluidCrystal formulations are should be stored at room temperature, specifically between 20ºC to 25ºC . Within the range of 15°C to 30°C, fluctuations are allowed. In case of unexpected temperature variations, products should have a fall-back at refrigerated storage conditions.

Patent info

Description

Peptide Slow Release Formulations

Brief description

A composition for the delayed delivery of a peptide active agent comprising;i) a salt of said peptide active agent comprising at least one positively charged peptide ion and at least one negatively charged counter-ionii) a sustained-release delivery vehicle,wherein the at least one negatively charged counter-ion is a halide ion, preferably a chloride or bromide ion.

Description

Lipid Depot Formulations

Brief description

The invention relates to pre-formulations made from low viscosity, non-liquid crystalline mixtures of a neutral diacyl lipid, tocopherol, phospholipid, and a biocompatible organic solvent. The bioactive agent is dissolved in the mixture, and the pre-formulation forms a liquid crystalline phase structure upon contact with an aqueous fluid. These preformulations are suitable for generating depot compositions for sustained release of active agents. The invention also relates to methods of delivery, treatment, and the use of preformulations in the manufacture of a medicament.

** Albayaty, M., Linden, M., Olsson, H., Johnsson, M., Strandgården, K., & Tiberg, F. (2017). Pharmacokinetic Evaluation of Once-Weekly and Once-Monthly Buprenorphine Subcutaneous Injection Depots (CAM2038) Versus Intravenous and Sublingual Buprenorphine in Healthy Volunteers Under Naltrexone Blockade: An Open-Label Phase 1 Study. Advances in therapy, 34(2), 560–575. https://doi.org/10.1007/s12325-016-0472-9 **

A study involving 89 healthy volunteers was conducted to evaluate the effectiveness of a new treatment for buprenorphine. The participants were divided into five groups: intravenous buprenorphine 600 µg, sublingual buprenorphine 8, 16, or 24 mg daily for 7 days, or four repeated weekly doses of CAM2038 q1w 16 mg. All subjects received daily naltrexone. The mean duration of buprenorphine release after CAM2038 q4w was 4-10 hours, with a mean terminal half-life of 19-25 days. Both CAM2038 formulations showed complete absolute bioavailability of buprenorphine, with 5.7- to 7.7-fold greater bioavailability compared to sublingual buprenorphine. Both CAM2038 q1w and q4w were well tolerated, with higher acceptance rates for CAM2038 than sublingual buprenorphine 1 hour post-dose.

Non-lamellar interfacial layer: from the organization of the adsorbed layer to the characterization of the internal structure. The self-assembly of lipids results in the formation of various nano-structures, including non-lamellar liquid crystalline structures like cubic, hexagonal, and sponge phases. These non-lamellar phases are crucial for living systems, providing compartmentalization and acting as biological activity regulators. They are of interest for pharmaceutical, food, and cosmetic applications due to their compartmentalizing nature. Understanding how these structures interact with different interfaces is essential for their use in biomedical devices for drug delivery and analysis. These non-lamellar interfacial layers can entrap functional biomolecules that respond to lipid curvature and confinement.

Access principles

Collaborate for development

Consider on a case by case basis, collaborating on developing long acting products with potential significant public health impact, especially for low- and middle-income countries (LMICs), utilising the referred to long-acting technology

Not provided

Share technical information for match-making assessment

Provide necessary technical information to a potential partner, under confidentiality agreement, to enable preliminary assessment of whether specific medicines of public health importance in LMICs might be compatible with the referred to long-acting technology to achieve a public health benefit

Not provided

Work with MPP to expand access in LMICs

In the event that a product using the referred to long-acting technology is successfully developed, the technology IP holder(s) will work with the Medicines Patent Pool towards putting in place the most appropriate strategy for timely and affordable access in low and middle-income countries, including through licensing
